Cavity Wall U-Values vary, see appendix D of TGD part L 2011.

Floor U Value varies, must be within Ranges set out in Table D1 of Appendix D of TGD part L 2011 for Psi values to be applicable.

Ensure insulation is secured firmly against inner leaf of cavity wall

Line of Air Barrier;

Refer to ACD’s for the barrier checklist and ensure requirements are met

Floor insulation to tightly abut blockwork wall

Install perimeter insulation with min. R value of 2.27m²k/W or greater (example 50mm of PIR λ 0.022 = R2.27)

X and Y are to Engineer’s Specification

Ensure wall insulation is installed at least 225mm below top of floor

All Blocks (Including Thermal Liteblocks) to be minimum 7.5N in accordance with TGD Part A 2012)

Use Roadstone Thermal Liteblock configuration A or B as advised by Y-Value calculation and Roadstone Technical Support

All Blocks (Including Thermal Liteblocks)

Roadstone Custom Psi values

Options A and B in the 0.15 and 0.18 W/m²K U Value ranges surpass default Psi values and therefore a default y-value of 0.08 can be assumed using these options without a y-value calculation, provided all other details in the building comply with the published ACDs / Roadstone details.

The diagrams, drawings and details included in this brochure are for indicative purposes only. They do not constitute nor should they be relied upon as giving/providing any design detail. They focus on the issues of thermal performance only. Insulation thicknesses of the main building elements have not been provided, as these are dependent on the thermal properties of the materials chosen, as well as on the desired U value. These diagrams, drawings and details illustrate good practice for the design and construction of interfaces solely in connection with thermal performance. The product should be used with due regard to all other requirements imposed by the Building Regulations and advice should be sought from a design professional in connection with the use of this product where required.
